

# Conductors and Insulators

[HTTPS://WWW.YOUTUBE.COM/WATCH?V=HJDJ4BGX6MW](https://www.youtube.com/watch?v=HJDJ4BGX6MW)

# Conductors

- ▶ Allow Movement of Electrons
- ▶ Good & fair Materials
- ▶ Metals = BEST! Ex. Aluminum, Copper, Steel
- ▶ Non-Metals are fair/semi conductors . Ex. Salt Water, Graphite

## Aluminum and Copper

# Insulators

- ▶ Reduce/ Limit the movement of electrons
- ▶ DON'T allow an electric current to pass through it
- ▶ HOLD electrons...Thus these materials HOLD any given Charge

Wood

Rubber

Cloth

Glass &  
Ebonite Rod

# Insulators

- ▶ Allow us to use electronics Safely
- ▶ Electrons are tightly bound to the atom, (Cant move very far or fast)

Rubber

# Thinking

- ▶ With the person beside you think of 3 things that have both conductors and insulators
- ▶ Previous ex. Cell phone chargers

# Band Theory

- ▶ Electrons occupy energy levels called bands
- ▶ Conductors implies that the outer electrons of the atom are loosely bound and free to move through materials in the conduction band of an atom
- ▶ BUT the electrons need LOTS and LOTS of energy to get to this conduction band
- ▶ Metals naturally connect electrons to this conduction band, so they require less energy to get there
